# Key issues in the framework of reference missions

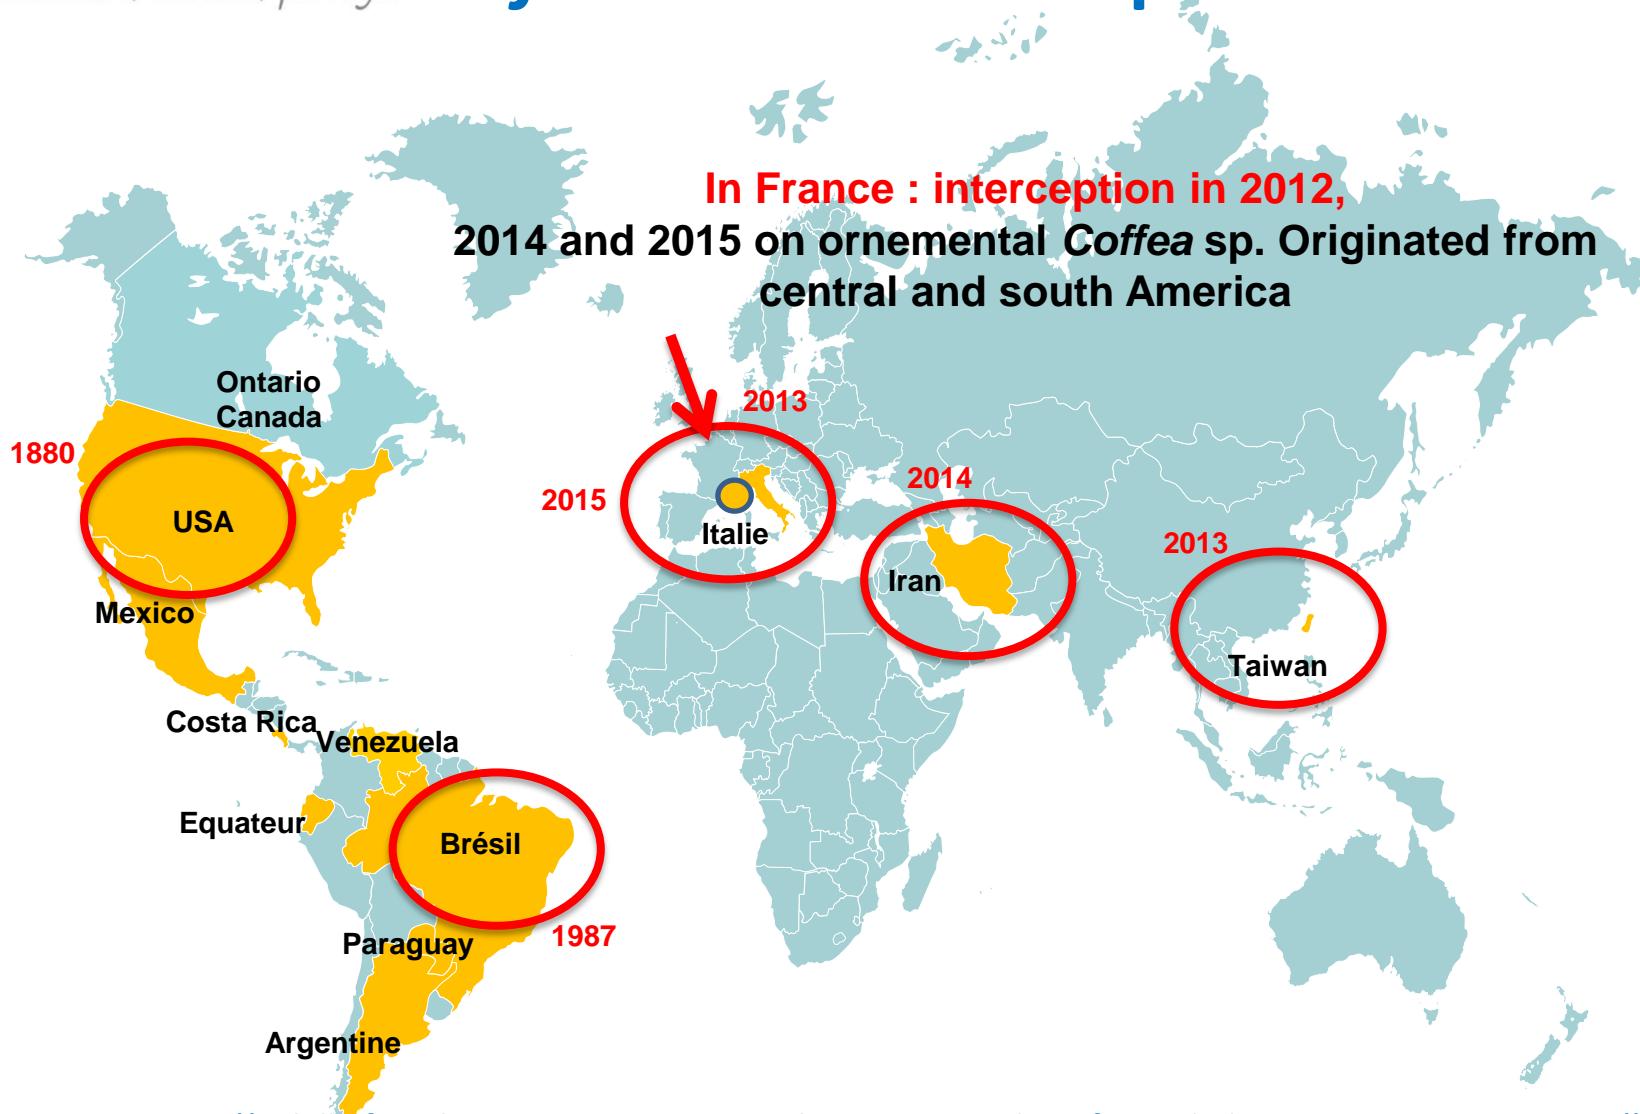

The intensification and the **globalization** of the **international trade** contribute to **increasing** risks for distribution of harmful organisms to plants from one region of the world to another.

## The NRL has to:

- develop **reliable methods of analysis** to improve the **monitoring** and **control** of the sanitary state of the territory,
- develop the **best tools** for **early detection** of new harmful organisms and to be able to detect any emergence of **harmful species**,
- coordinate the **network of laboratories** in charge of **official analysis** by training organizing proficiency testing.

# Facing an emergence of pest like *X. fastidiosa* in Europe

# First detection on coffee trees imported

2012/165 *Xylella fastidiosa* detected in a containment facility in France

2012:  
France

In April 2012, *Xylella fastidiosa* (EPPO A1 List) was identified on *Coffea* spp. plants kept under confinement by a breeding company which regularly imports plant cuttings, in particular from South America where the bacterium is known to occur. The bacterium was detected during tests carried out at the initiative of the breeding company itself. 84 samples collected from 84 plants had been sent to a private laboratory. Out of the 84 samples, 5 tested positive by ELISA. These positive samples were tested by PCR for confirmation by the French official reference laboratory. The presence of *X. fastidiosa* was confirmed in 1 sample. The French NPPO then collected additional samples from 20 plants and the presence of the bacterium was finally confirmed in 3 plants. Strict eradication measures were taken: all 84 plants kept in the containment facility were destroyed, the

2015:  
Switzerland

2015/181 *Xylella fastidiosa* detected in *Coffea* spp. plants imported into Switzerland

Following the detection of *Xylella fastidiosa* (EPPO A1 List) by the Dutch NPPO in imported *Coffea* plants, tracing-forward studies were conducted in Switzerland on re-exported lots. In September 2015, the presence of *X. fastidiosa* was confirmed in 4 *Coffea* plants

## “Validation of methods (5.4.5):

Validation is the confirmation by examination and the provision of objective evidence that the particular requirements for a specific intended use are fulfilled.

Definition of intended use is needed (which purpose), and proofs should be given.

### How to perform validation of methods:

Validation must be performed in the case of use of :

- Non standard methods,
- Home designed methods
- Standard methods uses outside their normal use

Specific requirements for  
laboratories preparing  
accreditation for a plant pest  
diagnostic activity  
EPPO PM 7/98

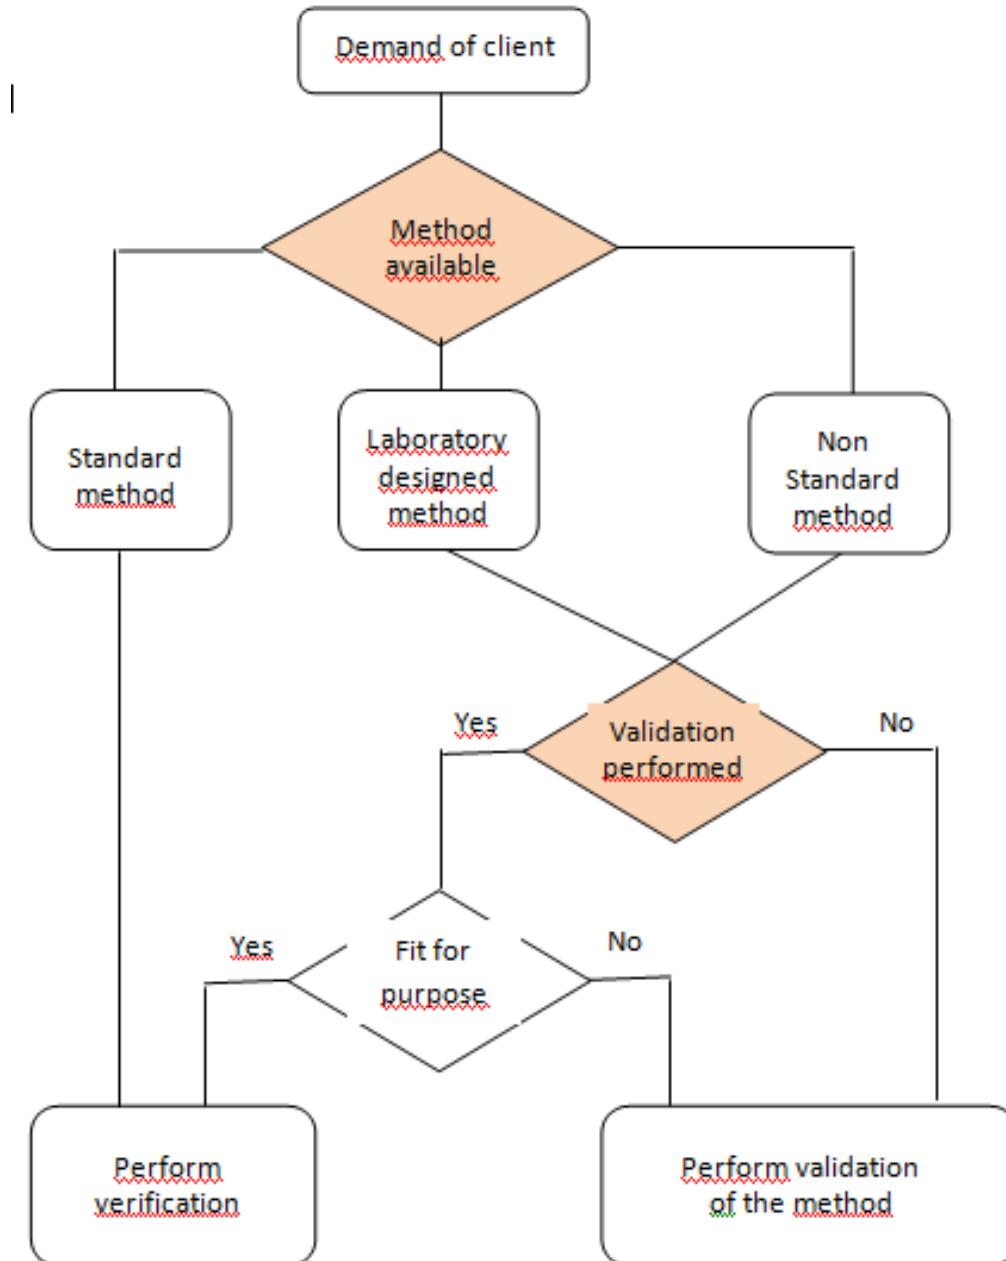

### How to perform validation:

- using reference standards or reference materials;
- by comparison of results achieved with other methods;
- by interlaboratory comparisons;
- by systematic assessment of the factors influencing the result;

# Test methods and method validation

Method selection process

## Evaluation of the performance criteria

**Diagnostic sensitivity:** Proportion of infected/infested samples testing positive compared to results from an alternative test (or combination of tests).

**Sensitivity** = true positives/(true positives + false negatives);

**Specificity:** Proportion of uninfected/uninfested samples (true negatives) testing negative compared to results from an alternative test (or combination of tests).

**Specificity** = true negative results/(true negatives + false positives);

**Accuracy:** closeness of agreement between a test result and the accepted reference value;

**Repeatability:** Level of agreement between replicates of a sample tested under the same conditions;

**Reproducibility:** Ability of a test to provide consistent results when applied to aliquots of the same sample tested under different conditions (time, persons, equipment, location, etc);

**Limit of detection (analytical sensitivity):** Smallest amount of target that can be detected reliably.

## Evaluation of the performance criteria by internal validation

		Reference results	
		Positive	Negative
Test result	Positive	PA (Positive agreement)	PD (Positive deviation)
	Negative	ND (Negative deviation)	NA (Negative agreement)

Performance criteria	Calculation
Accuracy (AC)	$AC = \frac{\sum PA + \sum NA}{N}$
Sensitivity (SE)	$SE = \frac{\sum PA}{N^+}$  <i>Comments: the result of the calculation (1-SE) gives the rate of false negatives obtained by the laboratory.</i>
Specificity (SP)	$SP = \frac{\sum NA}{N^-}$  <i>Comments: the result of the calculation (1-SP) gives the rate of false positives obtained by the laboratory.</i>
Repeatability (DA) (accordance)	DA = Percentage chance of obtaining the same result (positive, negative or indeterminate) from two identical samples analyzed in the same laboratory.  <i>Calculation adapted from ISO 16140.</i>

## Performance statistics by external validation: ring test

Example : For each laboratory, calculation of sensitivity, specificity and accuracy

Sample	Assigned value	Laboratory result	Interpretation of laboratory result	Calculation of the performance statistics of the laboratory
A	+	+	PA	
B	+	+	PA	
C1	+	-	ND	
C2	+	-	ND	
C3	+	+	PA	
D	+	+	PA	
E	+	+	PA	
F1	+	+	PA	
F2	+	-	ND	
F3	+	-	ND	
G	-	-	NA	
H	-	-	NA	
I	-	-	NA	
J	-	-	NA	
K	-	-	NA	
L	-	-	NA	
M	-	ind	PD	$SE = \frac{\sum PA}{N^+}$ = 6/10 x 100% = 60%
N	-	-	NA	
O	-	-	NA	
P	-	-	NA	$SP = \frac{\sum NA}{N^-}$ = 9/10 x 100% = 90%
				$AC = \frac{\sum PA + \sum NA}{N}$ = 15/20 x 100% = 75%

## Facing an emergence of pest like *X. fastidiosa*: validation of method

- Need to rely on diagnosis methods with performant detection threshold to detect latent infections

Role of the national reference laboratory : to select, evaluate and validate methods (molecular tools)

### ➤ First step : selection based on scientific publications

(methods able to detect all *X.f.* subsp.)

- PCR (Firrao & Bazzi, 1994)
- PCR (Pooler & Hartung, 1995)
- PCR (Minsavage *et al.*, 1994)
  
- Real-Time PCR (Harper *et al.*, 2010, erratum 2013)
  
- LAMP (Harper *et al.*, 2010)

Note: ELISA not selected / not adapted to early detection (low sensitivity)

# Facing an emergence of pest like *X. fastidiosa*: validation of method

## ➤ Second step: evaluation of methods on pure cultured strains

### Inclusivity

Capacity of a method to detect all the target strains

- 15 strains of *X. fastidiosa* – 4 subspecies

Results :  
100% for all the methods

### Exclusivity

Capacity of the method to not give false positive results with non-target strains

- 29 non-target strains :

Genetical proximity 16 *Xanthomonas* spp.

Same host plants 1 *Xylophilus ampelinus*

1 *Ca. Liberibacter asiaticus*

6 *Coffea* spp. saprophytes and

Results :  
100% for all the methods

1 *Ca. L. africanus*

4 *Citrus sinensis* saprophytes

### Detection threshold

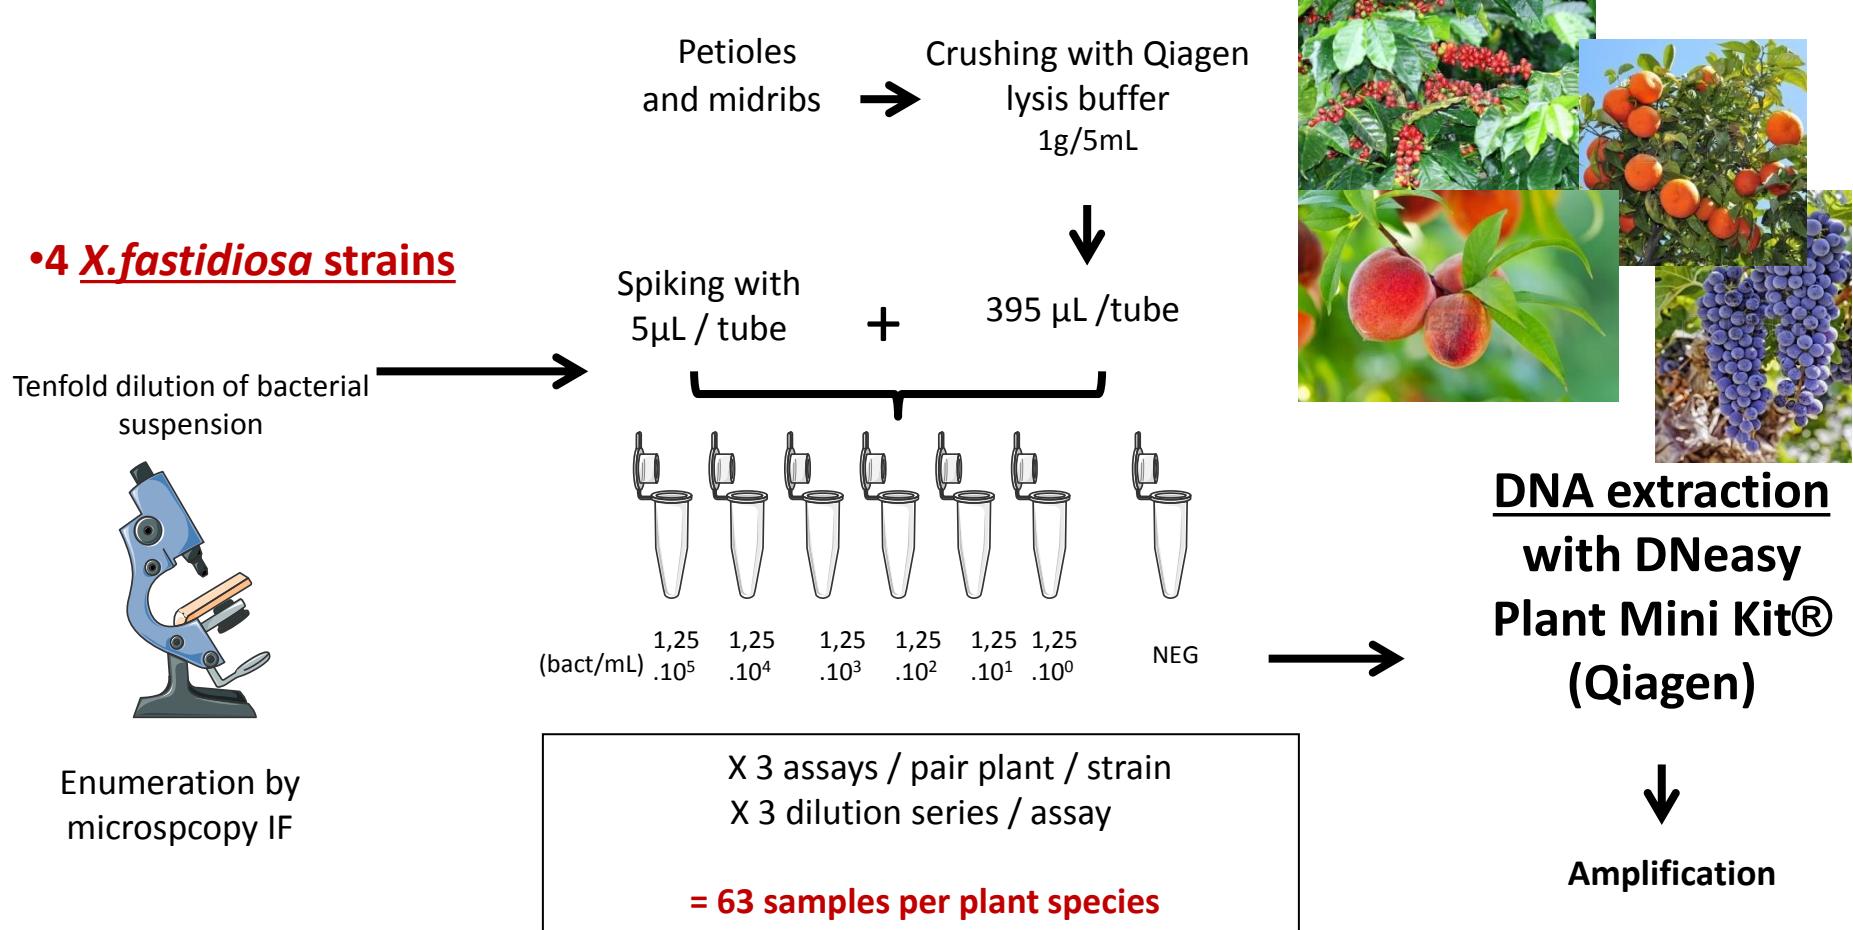

Enumeration by microscopy IF  
DNA extraction by thermal lysis

Best results : Real-Time PCR Harper (2010) > PCR  
Minsavage (1994)

# Facing an emergence of pest like *X. fastidiosa*: validation of method

## ➤ Third step: evaluation on spiked plant samples

- **5 plant species:** 2 *Coffea* sp., grapevine, sweet orange and peach tree

# Facing an emergence of pest like *X. fastidiosa*: validation of method

## ➤ Third step: evaluation on spiked plant samples

### Definitions:

- **Diagnosis sensitivity**: proportion of infected sample giving a positive result
- **Repeatability**: level of agreement between replicates of a sample tested under the same conditions

Best results with the Real-Time PCR Harper *et al.*, 2010

Criteria	Real-Time PCR Harper <i>et al.</i> , 2010	End point PCR Minsavage <i>et al.</i> , 1994
Diagnosis sensitivity (%)	77 to 97	65 to 82
Repeatability (%)	93 to 98	80 to 98
Detection threshold* (bact./g plant tissues)	$5 \cdot 10^2$ to $5 \cdot 10^3$	$5 \cdot 10^2$ to $5 \cdot 10^4$

→ But variability in the results according to plant matrices

## ➤ Fourth step: inter-laboratories evaluation

- 7 participating laboratories (France, Italy, UK, New-Zealand, Netherland)
- 5 spiked matrices

Samples	Plant and strain	Concentration (bact./mL)	Expected result
1	Coffee ( <i>Coffea arabica</i> ) <i>X. f. subsp. pauca*</i> CFBP8072	3,4E+04	Positif
2		3,4E+03	Positif
3		3,4E+02	Positif
4		0 (matrice saine)	Négatif
5	Olive tree ( <i>Olea europaea</i> ) <i>X. f. subsp. multiplex</i> ATCC35871 (CFBP8173)	2,8E+06	Positif
6		2,8E+05	Positif
7		2,8E+04	Positif
8		0 (matrice saine)	Négatif
9	Grapevine ( <i>Vitis vinifera</i> ) <i>X. f. subsp. fastidiosa</i> ATCC35879 (CFBP7970)	1,1E+06	Positif
10		1,1E+05	Positif
11		1,1E+04	Positif
12		0 (matrice saine)	Négatif
13	Orange tree ( <i>Citrus sinensis</i> ) <i>X. f. subsp. pauca*</i> CFBP8072	3,1E+03	Positif
14		3,1E+02	Positif
15		3,1E+01	Positif
16		0 (matrice saine)	Négatif
17	Peach tree ( <i>Prunus persica</i> ) <i>X. f. subsp. multiplex</i> ATCC35871 (CFBP8173)	2,8E+04	Positif
18		2,8E+03	Positif
19		2,8E+02	Positif
20		0 (matrice saine)	Négatif

# Facing an emergence of pest like *X. fastidiosa*: validation of method

## ➤ Fourth step: inter-laboratories evaluation

→ Confirmation of the performances of the method

Performance criteria	DNeasy® extraction + Real-time PCR Harper <i>et al.</i> , 2010
Diagnostic sensitivity	97%
Specificity	100%
Repeatability	91%
Reproducibility	84%
Limit of detection (with detection probability of 100%)	<u>Depending of matrices:</u> <ul style="list-style-type: none"> <li>➤ orange tree: <b>3.10<sup>2</sup> bact/mL</b></li> <li>➤ coffee tree: <b>3.10<sup>4</sup> bact/mL</b></li> <li>➤ peach tree: <b>3.10<sup>4</sup> bact/mL</b></li> <li>➤ olive tree: <b>3.10<sup>5</sup> bact/mL</b></li> <li>➤ grapevine: <b>3.10<sup>6</sup> bact/mL</b></li> </ul>

→ Necessity to improve the limit of detection on complex matrices

# Facing an emergence of pest like *X. fastidiosa*: validation of method

- Comparison with an alternative extraction method: QuickPick™SML Plant DNA (Bio-Nobile) vs DNeasy®

Performance criteria (%)	DNeasy® Plant mini kit Qiagen	QuickPick™ + Robot (BioSprint 15 = KingFisher™ mL)	QuickPick™ + magnets (manual protocol)
Sensitivity	52,8	80,6	79,2
Specificity	100	100	100
Repeatability	97,8	97,8	96,6
Limit of detection	Orange≈ 10 <sup>2</sup> bact./mL Grapevine≈10 <sup>6</sup> bact./mL Olive≈10 <sup>5</sup> bact./mL	Orange≈ 10 <sup>2</sup> bact./mL Grapevine≈10 <sup>3</sup> bact./mL Olive≈10 <sup>4</sup> bact./mL	

→ Improvement of the limit of detection

# Facing an emergence of pest like *X. fastidiosa*: validation of method

Performance criteria of the method	DNA extraction: QuickPick™ + KingFisher™ mL Amplification Harper <i>et al.</i> , 2010 (Erratum 2013)		
Inclusivity	<b>100% (23 targeted strains representing the 4 major subsp.)</b>		
Exclusivity	<b>100% (29 non-targeted strains: <i>Xylophilus</i>, <i>Xanthomonas</i>, <i>Liberibacter</i>, sap saprophytes)</b>		
<b>Plant matrix ( <math>10^2</math> - <math>10^5</math> bact./mL, 15 samples)</b>			
Matrix	Orange tree + <i>X. f. pauca</i> CFBP 8072	Grappe + <i>X. f. fastidiosa</i> CFBP 7970	Olive tree + <i>X. f. multiplex</i> CFBP 8173
Sensitivity	<b>100%</b>	<b>94%</b>	<b>67%</b>
Specificity	<b>100%</b>	<b>100%</b>	<b>100%</b>
Repeatability	<b>100%</b>	<b>96%</b>	<b>100%</b>
Reproducibility	<b>98%</b>		
Detection threshold (with detection probability of 100%)	$\approx 10^2$ bact./mL	$\approx 10^3$ bact./mL	$\approx 10^4$ bact./mL

The presence of inhibitors (polyphenol, secondary metabolites,...) in some plant matrix (olive tree, oak) limits its sensitivity.  **To be aware of false negative in Olive tree**

# Facing an emergence of pest like *X. fastidiosa*: detection

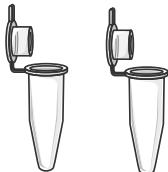

- The most performant method for early detection of *Xylella fastidiosa* in various matrices: DNA extraction with QuickPick™ (Bio-Nobile)+ Real-Time PCR (Harper et al., 2010)  **French reference and official method: MA039 .**  
[https://www.anses.fr/fr/system/files/ANSES\\_MA039\\_Xylella fastidiosa final.pdf](https://www.anses.fr/fr/system/files/ANSES_MA039_Xylella%20fastidiosa%20final.pdf)

**1 sample = 5 to 100 petioles = 0.5 to 1 g**  
grounding in sterile water (5 mL/g)

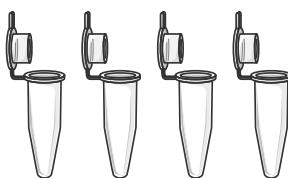

250 µL of macerate per replicate

**2 DNA extractions / sample**

- Automated DNA extraction  
QuickPick™ Plant DNA kit (Bio-Nobile)  
and KingFisher™ mL

**4 amplifications**

- Real-time PCR Harper et al., 2010

# Facing an emergence of pest like *X.fastidiosa* - First detection in Corsica – July 2015

## 2015/144 First report of *Xylella fastidiosa* in France

The NPPO of France recently informed the EPPO Secretariat of the first record of *Xylella fastidiosa* (EPPO A1 List) on its territory. During an official visual inspection, carried out in the framework of the surveillance programme against *X. fastidiosa*, a hedge of 31 desiccated plants of *Polygala myrtifolia* was observed on 2015-07-20, on the island of Corsica. This hedge was located along a wall, near a parking lot, in a commercial area of the municipality of Propriano (Corse du Sud department). Samples were collected and tested (real-time PCR, IF) by the ANSES reference laboratory. The identity of the bacterium was confirmed on 2015-07-22 and serological tests revealed a high concentration of the bacterium in tested plant tissues. The isolation of the bacterium on growing medium is under way and results will probably be obtained within 3 to 4 weeks. It is suspected that infected *P. myrtifolia* plants had been imported from another EU member state, but a study is being carried out to confirm this. All infected *P. myrtifolia* plants were destroyed by burning on 2015-07-23.

In accordance with a contingency plan, official phytosanitary measures were immediately taken to eradicate the disease (e.g. insecticide treatments, plant destruction). An infected area with a radius of 100 m around infected plants has been demarcated, as well as a buffer zone with a 10 km radius. Further studies are being made to determine the extent of the infected area. All known host plants of *X. fastidiosa* located in the infected area, as well as any plant showing suspicious symptoms, are being destroyed. In the infected area, the following host plants were present: *Rosmarinus officinalis*, *Westringia*, *Polygala myrtifolia* and *Olea europaea* (as explained above, only *P. myrtifolia* plants were found to be infected). On 2015-07-22, insects were collected by aspiration and specimens are being identified by the entomology laboratory of Anses. Finally, an information campaign has been launched, in particular to warn passengers that they should not bring plants into Corsica.

The pest status of *Xylella fastidiosa* in France is officially declared as:

Corsica: Transient, actionable, under eradication.

Mainland: Absent, intercepted only.

Source: NPPO of France (2015-07).

Palencia , 20 de septiembre de 2016 (GEDDI-SEF)

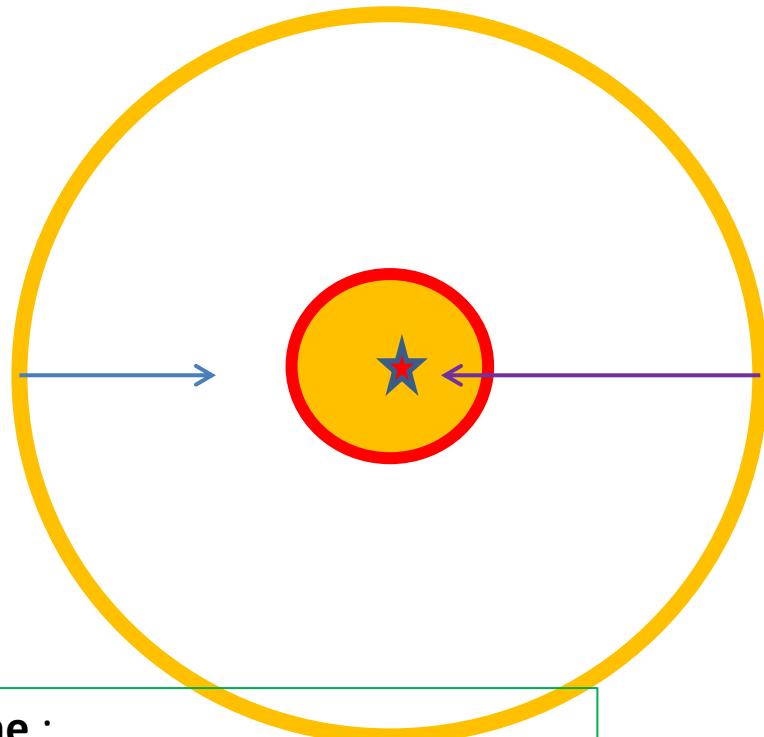

# Emergency plan and survey in infected zone

## Buffer zone

### (Diameter 10 km):

- Visual observation of symptoms on specified plants
- Transfer of plants within this zone submitted to rules

## In all delimited zone :

- no circulation of specified plants : in particular, no specified plant for planting goes out the delimited zone (including from nurseries)
- Surveillance and monitoring

## In the infected zone

### (Diameter 200 m):

- vector treatment
- sampling of specified plants
- destruction (priority to Polygala and any plant with symptom)
- no plantation of host plants

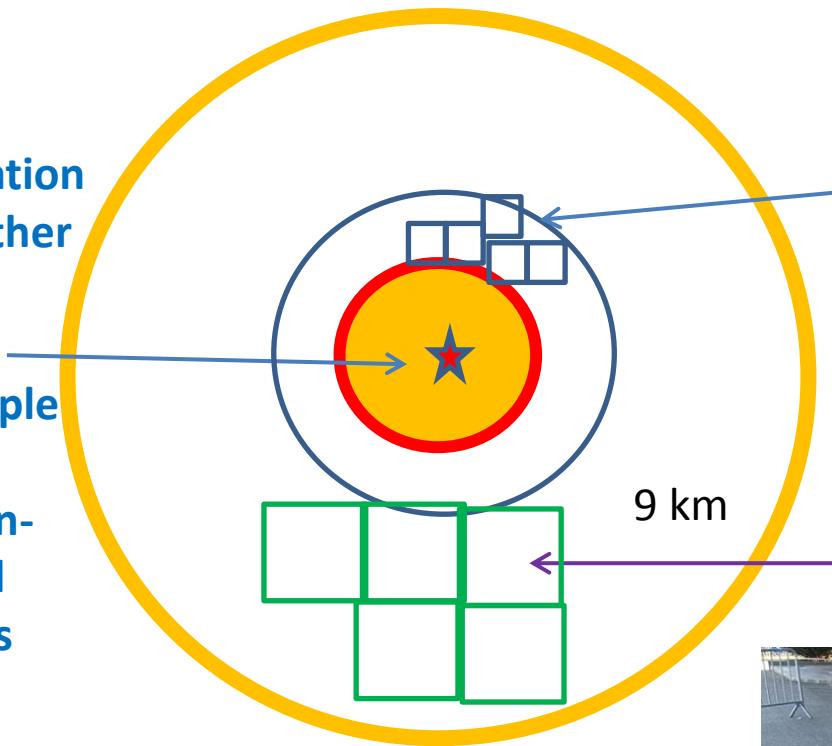

Source INRA

# Emergency plan and survey in infected zone

**Objective:** Identification of infected plants other than plants index

**Representative sample** of 100 plants of the specified plants (non-host) in the infected area of 100 m radius (~ 3ha)

Source FREDON/SRAL Corsica

# Official and non official survey out of infected zone

## Phytosanitary inspections within Official survey of regulated pest and specific to *Xylella fastidiosa* :

- assess the phytosanitary status and detect infections in susceptible plants, including those of economic importance or located in region with risk (south of France).
- Inspections non specific to *Xylella fastidiosa* .
- Inspection within framework of (EPP):
- Control of retailers (garden centers, nurseries, etc.)

**45 plants host of subsp *multiplex*, *pauca* et *fastidiosa* of *Xylella fastidiosa* to survey**

**Visual inspections + systematic sampling** on symptomatic plants

### Special case: sampling on asymptomatic plants

- mother plants of host plants (5 samples / host specie)
- specified plants originating from a third country contaminated (5 samples / specie specified)

**Productions at risk**

- Fruit trees**
- Grape Vines**
- **Ornamentals**
- **Aromatic, medicinal and condiment plants**

# Official and non official survey out of infected zone

- **Non official scheduled survey**

Network of biological survey of territory : Grape Vine, *Citrus*,  
*Prunus*, Oaks, *Platanus*, Olive Tree

Forest Services : Different oaks (*Quercus suber*, *Quercus ilex*)

- **Phytosanitary controls on imports and exports**

*Coffea* prohibited from Costa Rica/Honduras

- **The event-monitoring :** aims at **early detection** of infection in the country.

It is based on existing monitoring devices (regular monitoring within the epidemiological surveillance network), including other regulated pests  
(Phytoplasma of the grapevine Flavescence dorée or PPV).

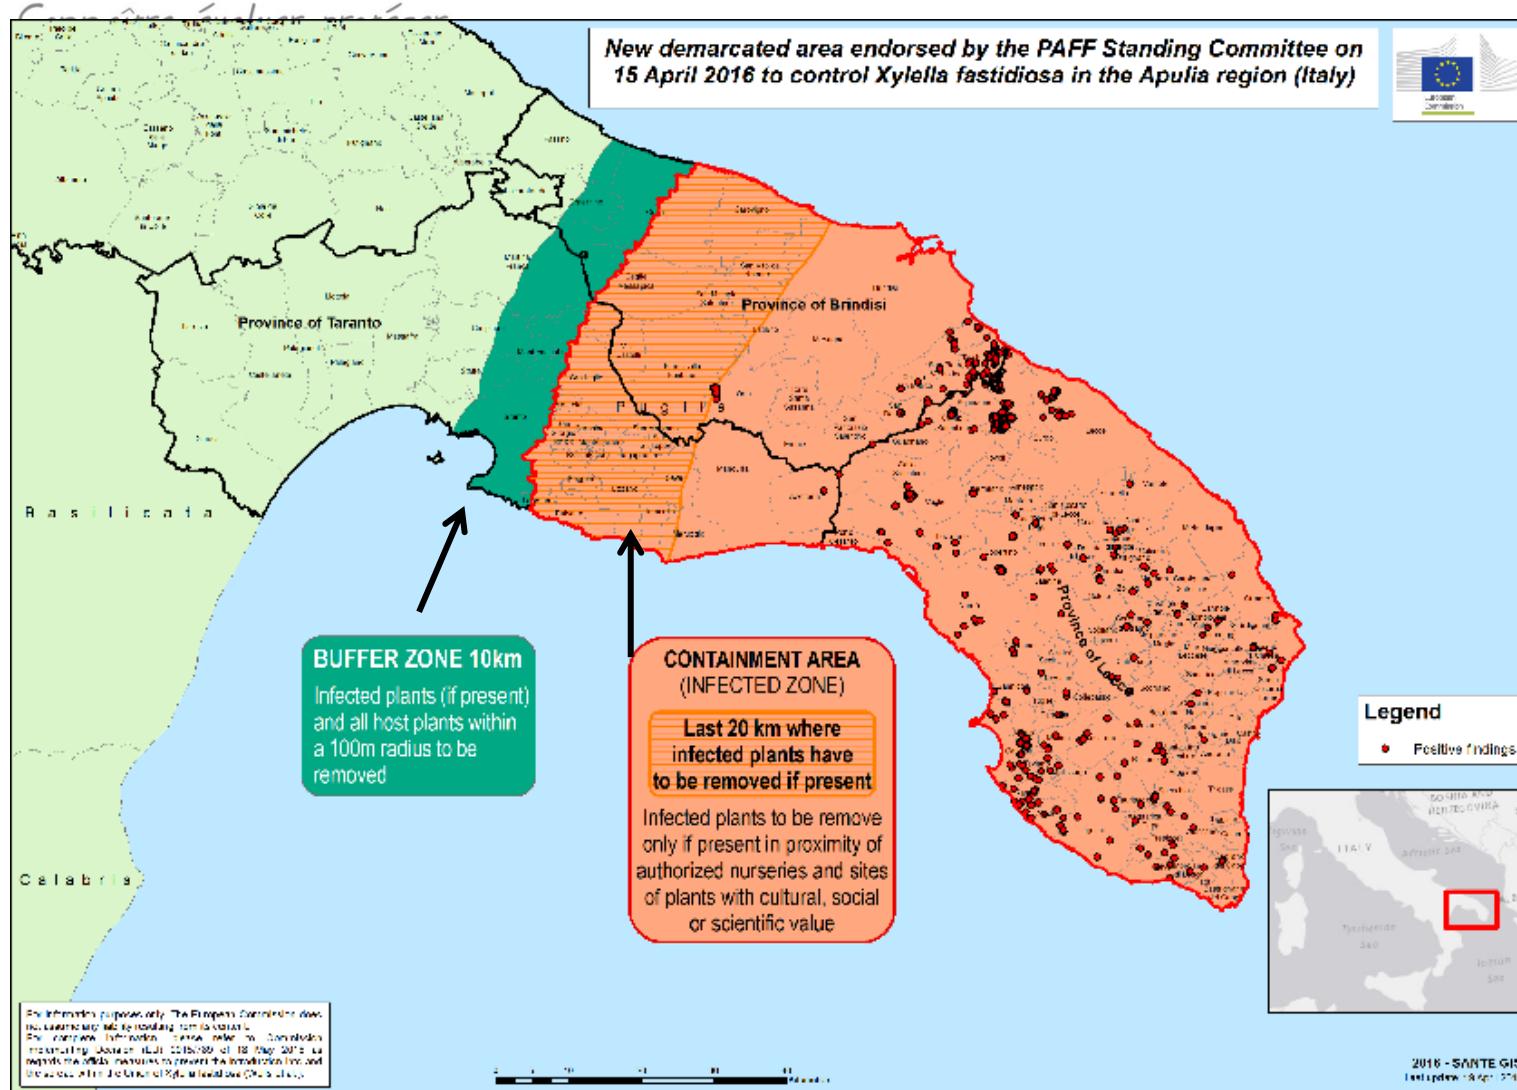

Observers of this network trained to recognize the symptoms, are encouraged to strengthen their vigilance during diagnostic susceptible plants at *X. fastidiosa*.

- **Reporting by individuals to official services**

<b>LSV 47.61</b>	<i>multiplex</i> ST6	<i>Calicotome villosa</i>	2016

(MLSA/MLST done at INRA Angers - Emersys)

## Identification of isolates of *Xylella fastidiosa*

4 isolats from south of France

Ref.	Subsp.	Host plant	Year
LSV4711	<i>multiplex</i> ST6	<i>Polygala myrtifolia</i>	2015
LSV4712	<i>multiplex</i> ST6	<i>Polygala myrtifolia</i>	2015
LSV4715	<i>multiplex</i> ST7	<i>Polygala myrtifolia</i>	2015
<b>LSV 47.32</b>	<i>multiplex</i> ST7	<i>Spartium junceum</i>	2016

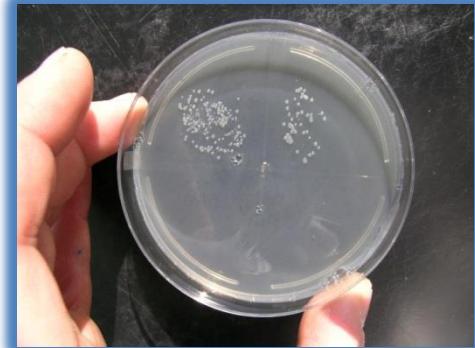

8 isolats on coffee imported and intercepted

Ref.	Subsp.	Host plant	Year
LSV4103	<i>pauca</i> ST74	<i>Coffea arabica</i>	2012
LSV4209	<i>fastidiosa /sandyi</i> ST75	<i>Coffea canephora</i>	2012
LSV4627	<i>sandyi</i> (atypical) ST72	<i>Coffea arabica</i>	2015
LSV4628	<i>sandyi</i>	<i>Coffea arabica</i>	2014
LSV4639	<i>sandyi</i>	<i>Coffea arabica</i>	2014
LSV4659	<i>sandyi</i>	<i>Coffea sp.</i>	2014
LSV4709	<i>pauca</i> ST53	<i>Coffea arabica</i>	2015
<b>LSV 47.33</b>	<i>pauca</i> ST53	<i>Coffea arabica</i>	2016

(MLSA/MLST done at INRA Angers - Emersys)

- Jacques *et al.*, New variants of coffee-infecting *Xylella fastidiosa* issued from homologous recombination. Appl. Environ. Microbiol., 2016.

Medium PWGm

Isolation of strain of *Xylella* is difficult

Characterisation and identification by MLSA/MLST directly on plant extract

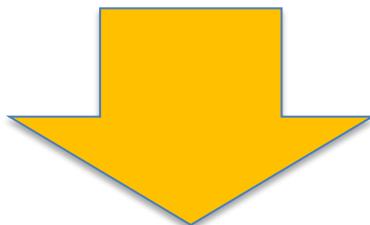

Symposio: "Xylella fastidiosa: una especie compleja causante de enfermedades emergentes en Europa"

Palencia , 20 de septiembre de 2016 (GEDDI-SEF)

## Identification of isolates of *Xylella fastidiosa* on plants

MLST scheme on strains (7 genes) (Work done at INRA)-Emersys

	ST	<i>cysG</i>	<i>gltT</i>	<i>holC</i>	<i>leuA</i>	<i>malF</i>	<i>nuoL</i>	<i>petC</i>
A	<b>7</b>	7	3	3	3	3	3	3
B	<b>6</b>	3	3	3	3	3	3	3

MLST direct on plant extract  
 50% of positive samples  
 were assigned to *Xylella fastidiosa* subsp multiplex
